

Compact S Hygiene Station

When placed in a hygiene sluice, preferably at the entrance to your production areas, this hygiene station results in optimum all-round hygiene. It is a sole-cleaning machine with built-in sole and hand disinfection.

After the hands have been disinfected, the turnstile is released for a short period. Once this period has expired, the hands must be disinfected again.

When sensors detect that an employee has entered the machine, two brushes begin to rotate and the soles of the employee's shoes are thoroughly cleaned. The brushes in question are horizontally placed and covered by a stainless steel grid

This hygiene sluice construction is made entirely out of type 304 stainless steel and has a matt finish. The hygiene station has an electrical control box with a stainless steel housing.

Nominal load: 3 x 400 V, 50Hz.

Power: 0.80 Kw.

Floor area: 1,616 mm x 949 mm

The machine is constructed in accordance with CE standardisation and meets the highest hygiene and quality requirements.

Compact S turnstile with hand disinfection

After the hands have been disinfected, the turnstile is released for a short period. Once this period has expired, the hands must be disinfected again.
